Identity number assigned by the Republic Institute of Statistics	01029606								
Dean of the organizational unit	PhD Božidar Popović, Associate Professor								

# CURRICULUM

# FIRST STUDY CYCLE

# - AUTOMATION AND ELECTRONICS -

Teaching activities at the Faculty of Electrical Engineering in East Sarajevo are organized in three study cycles. Study cycles are carried out through study programs.

The first study cycle prepares students for a higher degree of study and enables them to acquire general and specific knowledge needed for employment in certain professional jobs. Upon completion of the first study cycle, the academic title of Bachelor of Science (B.Sc.) in Electrical Engineering is acquired, with an indication of the study program. Along with the diploma of the first study cycle, a diploma supplement is also issued for a more detailed insight into the level, nature, content, system and rules of study and the results achieved during studies. The educational degree of the first cycle in all study programs lasts four study years, i.e. eight semesters, which corresponds to 240 ECTS points.

The first study cycle is realized through the following study programs:

- Electric Power Engineering,
- Automation and Electronics,
- Computer Science and Informatics.

The decision for the final study program is made when enrolling at the faculty.

The general goals of the first study cycle at the Faculty of Electrical Engineering in East Sarajevo are efficient and rational higher education of personnel in the field of electrical engineering, through:

- guiding and helping the student during the teaching process,
- the introduction of only one-semester courses with a maximum of six hours of direct teaching,
- relieving teaching content of unnecessary repetitions and facts, with the necessary
  modernization that follows the rapid development in various areas of electrical engineering,
  increasing the number of hours of exercises and practical work compared to lectures,
- establishing a system of rules and criteria for quality assurance (QA) of the educational process,
- guidance through optional subjects,
- continuous monitoring and checking of students' knowledge,
- application of modern didactic methods.

Also, a modern multidisciplinary educated electrical engineering graduate who can successfully work in the economy and services where there is a need for this profile of personnel, is educated through:

- the introduction of optional subjects, which under certain conditions can also be subjects from another study program,
- introduction of common program contents for all study programs,
- the introduction of two practically oriented projects, which are valued as special subjects and obligations of professional practice.

The goal of the first study cycle is the professional preparation of the candidate for continuing education, in the second study cycle through:

- hiring teaching staff with recognized scientific results who are capable of motivating students for further professional and scientific training,
- introduction of the most modern teaching content in the professional part of studies, which can be a motivation and challenge for students to engage in scientific work.

General outcome of the learning process at the end of the first study cycle:

- knowledge and understanding of basic principles in the field of study,
- recognition of problems that arise in practice and the possibility of their quick and economical solution, using the most modern technical achievements in the specific field,
- ability to work in a team in a multidisciplinary environment,
- within the specialty and beyond, to follow the development and latest technical achievements and recognize the needs and opportunities to apply these achievements in the environment,
- developing the skills of self-learning, which enables to get the necessary comprehensive education,
- to respect legal regulations and social norms of behavior.

The first two years of study are common for all students, regardless of the chosen study program. All subjects in the first two years are compulsory. Here, students acquire the general knowledge necessary to continue with the chosen study programs.

In the third and fourth year of study, students are directed to the above three study programs. Students acquire knowledge specific to the study program they have chosen. A number of subjects are compulsory, while the rest are optional and chosen by students based on their interests and affinities. After completing eight semesters, each student works on and defends a final thesis. Students are able to apply the theoretical and practical knowledge acquired in targeted study programs in practice, and it also serves as a basis for continuing their studies in the second study cycle.

DEAN

Prof. Božidar Popović

	Qualification model

AUTOMATION AND ELECTRONICS	Дипломирани инжењер електротехнике – 240 ECTS – Аутоматика и електроника	Bachelor of science in Electrical Engineering –240 ECTS – Automation and Electronics	7	<b>07.023-3899/09</b> from 22. 06. 2009.								

### **QUALIFICATIONS STANDARD FOR THE STUDY PROGRAM: AUTOMATION AND ELECTRONICS**

### 1. BASIC CHARACTERISTICS

Study cycle: First study cycle Degree: Academic Study program: Automation and Electronics

### Name(s) of qualification (generic part + specific part):

Bachelor of science in Electrical Engineering – 240 ECTS – Automation and Electronics

#### Language of study: English

Study duration: The study lasts four years, and the year consists of two semesters (winter and summer).

#### Minimum volume - number of ECTS: 240 ECTS credits

Level: 7

**Conditions/method of admission:** The conditions for enrollment in the first study cycle of the study program Automation and Electronics, which is conducted at the Faculty of Electrical Engineering in East Sarajevo, are prescribed by the Law on Higher Education, the Statute and other acts of the University of East Sarajevo and the Faculty of Electrical Engineering in East Sarajevo. All persons who have completed a four-year high school in the Republic of Srpska and Bosnia and Herzegovina, the Republic of Serbia (Agreement on Special and Parallel Connections), as well as persons who have completed a four-year high school abroad (under the obligation to certify the certificate), have the right to enroll in the Faculty of Electrical Engineering. Upon enrollment, an entrance exam in mathematics is taken.

#### 1.1. Introduction to Qualification

Teaching in the study program Automation and Electronics (hereinafter AE) at the Faculty of Electrical Engineering of the University of East Sarajevo is conducted according to the curricula from 2012. The study program includes two narrow scientific areas: Automation and robotics, Electronics and electronic systems.

The study program is designed to educate engineers who will get enough professional and practical knowledge to work in the profession, and at the same time to enable further education at appropriate master's or doctoral studies.

The contents of the subjects in the lower years of study in the AE study program are designed to provide students with the necessary knowledge in general educational and theoretical subjects. This knowledge will serve them to understand the basics of electronics, electronic systems, systems with builtin computer and specialized computer systems, as well as the control of systems based on the principles of physics, mathematics, electrical engineering, signals and system theory.

The contents of the subjects in the higher years of study are specially designed, so that they provide students with professional and practical knowledge in the mentioned narrower scientific and professional fields. During studies, especially in professional (specialist) courses, independent work is especially valued, participation in specific professional and development projects within individual laboratories is encouraged and students' abilities to solve problems are enhanced and developed.

Upon successful completion of studies on the AE study program, the student is able to apply scientific and professional achievements in the field of electrical engineering, electronics, electronic systems, systems with built-in computer and specialized computer systems, as well as control of industrial systems based on the principles of signals and system theory in professional work, as well as finding new achievements in multidisciplinary areas that rely on the application of defined areas.

#### 1.2. Reasons for the existence of the qualification - justification

The purpose of this study program is the formation of highly educated personnel for the needs of the economy in the field of electrical engineering, automation and electronics. The current situation, development trends and the needs of the market for engineers in the field of automation and electronics served as the basis for defining the structure and content of the study program. When designing the AE study program, the following strategies and opinions were additionally taken into account:

- Strategy of scientific and technological development of the Republic of Srpska 2012-2016,
- · Requirements of chambers of commerce and associations of electrical engineers,
- · Opinions of business entities,
- Opinions of experts from various scientific and professional disciplines.

The social justification for the existence of the study program stems from the need for further development of the profession in the field of automation and electronics in the Republic of Srpska – Bosnia and Herzegovina, and the surrounding area. The high-quality education offered by this study program is the foundation for independent and lifelong learning in the field of automation and electronics, which is one of the important elements that have recently been current and present on the labor market. Support for this study program is also in the function of raising the quality of education and improving electrical engineering, electronics, automation and computer science in the Republic of Srpska – B&H, as well as in the function of forming young engineering staff in the Republic of Srpska – B&H.

According to the mentioned, the goals of the AE study program at the Faculty of Electrical Engineering in East Sarajevo are:

- Respect the strategic decisions of the society in those domains that rely on the application of knowledge and skills and the scientific fields of automation and electronics,
- Ensure that the learning outcomes of this study program correspond to the market needs,
- Improve learning outcomes by introducing modern teaching methods, using appropriate laboratory equipment and modern software tools,
- Create conditions for student mobility,
- To achieve national and international cooperation in the implementation of the teaching process within the AE study program,
- To create opportunities for lifelong learning of students after completing their studies.

### 2. COMPETENCES / LEARNING OUTCOMES

Upon successful completion of studies in the AE study program, the student acquires general knowledge, skills and competencies in the field of electrical engineering, electronics, electronic systems, systems with built-in computer and specialized computer systems, as well as control of industrial systems based on the principles of physics, mathematics, electrical engineering, signals and system theory.

### 2.1. List of competencies at the qualification level

# The general knowledge that a graduated engineer from the AE study program possesses includes:

- Basic knowledge of mathematics, physics, electrical engineering, automation, robotics, electronics and electronic systems, data transmission, computer technology and programming techniques,
- Basic knowledge of electromechanical energy conversion, basic principles of transmission and conversion of other forms of energy and other engineering disciplines,
- Knowledge of the connection of automation and electronics with the basic knowledge required for the development, design, manufacture and maintenance of automation and electronics systems,
- The ability to choose and apply appropriate methods in the development, design, manufacture and maintenance of automation and electronics systems, as well as drawing conclusions and testing hypotheses,
- The ability to work in various professional fields thanks to the acquired general, specialist and methodological competences during studies,
- Ability to use relevant literature, follow seminars and courses, acquire new knowledge and technologies, present the achieved work results to the professional public,
- Knowledge of standards, technical norms and regulations, as well as understanding the impact that automation and electronics systems, their operation and maintenance have on the environment,
- Ability to work individually and as a team, and to communicate with colleagues and the public about issues and problems related to the fields of automation and electronics.

## The specialist knowledge that a graduated engineer from the AE study program possesses includes:

- Assessment of the importance of Maxwell's equations for the development of science in general, especially their basic role in electrical engineering,
- Recognition and understanding of problems that arise in practice in the field of electromagnetics,
- · Realizes mathematical models of problems that arise in practice in the field of electromagnetics,

- Finding quick and economical solutions using the most modern calculation and design techniques in the field of electromagnetics,
- Understanding the importance of compliance with technical regulations and norms and legal regulations in this area of electrical engineering,
- Understanding the operation of voltage regulators and limiters,
- Understanding the operation of logic gates and the characteristics of logic families in which they are implemented,
- Designing simple electronic modules for powering electronic circuits,
- Designing specific circuits with operational amplifiers and analog comparators,
- Understanding the operation and proper use of components for galvanically isolated signal transmission,
- Designing astable multivibrators based on logic circuits, OP/AK and 555,
- Designing monostable multivibrators based on logic circuits, OP/AK and 555,
- Designing specific signal generators,
- Knowledge of the basics of classical theory of linear dynamic systems, control systems with feedback,
- Training students for the analysis and synthesis of servo systems as elements of complex control systems,
- Familiarization with the basic elements of the control loops, with different stability criteria of linear systems, basic linear control laws, evaluation of system behavior in transient and stationary regimes, etc.,
- Training students for the analysis and synthesis of linear and nonlinear dynamic control systems with feedback,
- Familiarization with methods of linearization of non-linear elements: static, differential, harmonic and stochastic, as well as with various stability criteria of non-linear systems, basic non-linear control laws, etc.
- Understanding the importance of applying power electronics converters, their functional and technical characteristics,
- Calculation of the parameters of a powerful circuit breaker in a specific application and the selection of a circuit breaker of the appropriate type and characteristics, as well as optimal ways of its tripping and protection,
- Selection of a converter for a specific application, with the appropriate topology and functional and technical characteristics,
- Designing the gate drivers and switching cells of the specific converter,
- Designing the basic parts of the control structures of the specific converter,
- Acquiring basic knowledge of transport processes,
- Analysis of thermal energy processes,
- · Selection and design of thermal energy equipment,
- · Automatic management of thermal energy devices and plants,
- · Assembly and commissioning of thermal energy equipment and plants,
- Warranty and operational tests,
- Revitalization and reconstruction of devices and plants,
- Knowledge of the physical foundations, characteristics and structure of electrotechnical materials (semiconductors, conductors, superconductors, dielectrics, magnetics, etc.),
- Knowledge of the application of materials in various electrotechnical devices,
- The ability to apply the acquired knowledge of materials science in practical work,
- The ability to monitor, understand and apply the latest achievements in the field of new materials,
- Basic theoretical knowledge about linear digital control systems,
- Practical knowledge of linear digital control systems,

- The student will be able to check and verify the acquired knowledge from digital control systems by computer simulations,
- The student will be able to apply the acquired knowledge in the analysis and design of a concrete system with direct digital control,
- Understanding the operation of standard combinational circuits and designing complex combinational assemblies,
- Understanding the operation of standard sequential circuits and designing complex sequential circuits,
- Understanding the operation and proper use of different memory circuits,
- Understanding the operation and proper use of A/D and D/A converters,
- Understanding of the structure and programming principles of programmable digital circuits,
- Understanding the importance of proper control of power electronics converters,
- · Selection of circuits for optimal driving and protection of semiconductor switches,
- Designing circuits for measuring the characteristic values of converters,
- Designing circuits for phase control of converters,
- · Designing circuits for voltage/current control of choppers,
- Understanding the principles of inverter control,
- Understanding the principles of digital control of power electronics converters,
- Use of specialized software for designing control of converters,
- Understanding the basic trends and significance of the ongoing nanotechnological revolution,
- Familiarization with the latest research and perspectives in the field of nanoelectronics,
- · Connecting previously acquired knowledge with the current development of nanotechnologies,
- Ability for independent professional work: selection and analysis of professional and scientific literature related to a certain aspect of nanotechnology research, as well as their presentation,
- Mastering the basic theoretical and practical knowledge of digital signal processing,
- · Getting to know digital signals in the frequency domain,
- Getting to know digital filters and mastering the basic methods of their design,
- · Familiarization with the implementation and areas of application of digital filters,
- Mastering the basic theoretical and practical knowledge from the analysis of continuous signals and systems in the time and frequency domain,
- Understanding the most general descriptions of systems, their classification and qualitative properties,
- Gaining insight into the overview of algorithms for the analysis of linear time-invariant systems in the time and complex domains,
- Familiarization with the concept of analog filtering,
- Familiarization with the working principles of transformers and rotary electrical machines,
- · Ability to determine the parameters and characteristics of electrical machines,
- · Familiarization with the principles of regulation and starting of electrical machines,
- · Familiarization with the operation of electrical machines in the power system,
- · Getting to know the basic elements of power plants,
- Mastering the basic procedures of analog and digital signal analysis,
- Mastering the basic procedures of linear and non-linear transmission systems,
- Mastering the principles of transmission of analog and digital signals in the basic and transposed range,
- Work in the laboratory and familiarization with practical communication systems,
- · Acquiring basic theoretical knowledge about different optimization methods,
- Mastering the basic theoretical knowledge that is necessary for finding the optimal solution to a specific problem,
- Enabling the student to check and verify acquired knowledge through computer simulations,

- Enabling the student to apply the acquired knowledge in solving numerous problems in and outside the profession,
- Knowledge of the basic principles of system operation with a built-in computer (microprocessor/microcontroller),
- Designing, testing and implementing a hardware functional unit with (microprocessor/microcontroller) based on the given specification,
- Modeling, designing, testing and implementing simple application and system programs in symbolic machine language for a given microcomputer system,
- Modeling, designing, testing and implementing simple application and system programs in a high-level programming language for a given microcomputer system,
- · Application of various methods of mathematical process analysis in engineering practice,
- · Performing the synthesis of mathematical process models,
- Use of software tools MATLAB, SIMULINK and MAPLE for the implementation of developed mathematical models,
- Performing the exploitation of the results obtained from the model in engineering practice,
- Using different process identification methods,
- Using different methods of designing automation control systems,
- Use of MATLAB, SIMULINK and MAPLE software tools for process identification and automation control system design,
- Application of various methods of process identification and automation control system design in practice,
- Basic knowledge of computer process control,
- Knowledge for PLC programming,
- Knowledge related to the application of PLCs in industry,
- Knowledge related to PLC maintenance,
- · Basic knowledge of remote monitoring and control systems,
- Getting to know the basic concepts of electronic communication systems,
- · Acquiring fundamental knowledge about computer networks and their operation,
- Acquiring theoretical and practical knowledge about the concepts of data transmission in communication networks,
- Understanding of data acquisition systems, intelligent sensors and the concept of the Internet of Things (IoT),
- Understanding and developing the perception of measuring non-electric quantities using sensors, bearing in mind that the output signal of current or voltage must be in the form of standard signals,
- Understanding and differentiating sensors, as well as the technique of measuring non-electric quantities,
- Understanding the principles of operation and application,
- Understanding and application of binding schemes and adjustment of output quantities.

COMPETENCY MATRIX OF STUDY PROGRAM AUTOMATION AND ELECTRONICS	General subjects	Fundamental subjects of engineering	Professional subjects	Projects and students practice	Final thesis
Fundamental knowledge in mathematics, physics, electronics, electrical engineering, computer science and programming technics	Х	х			
Independent work with basic software tools	х	х			
Ability to analyse and model different physical manifestations and entities, simple components, devices, and systems from the field of electrical engineering	х	х			
Independently conduct experiments, statistical processing of the experimental results, analyse and understand the experiments, formulate, and conduct conclusions to understand the processes, devices or systems	х	х	х	х	Х
Chose and apply proper methods of analysis, modelling, simulation and optimization of complex components, devices and systems from the fields of automation, robotics, electronics and electronic systems		Х	х	х	
Ability to apply acquired theoretical knowledge in practice			х	Х	
Ability to apply standards, technical regulations, as well as to understand the influence of the components, devices and systems of automation and electronics, their operation and maintenance			х	х	х
Ability to successfully participate in various teams, to gain basic skills of leadership in the project teams			х	х	
Able to develop critical opinions, to identify and analyse problems, predict behaviour of the selected solution with clear outcome of good and/or bad choice			х	х	Х
Able to use scientific and professional literature	х	Х	х		
Specially trained for combination of basic knowledge from different scientific and professional areas, considering the specifics of the study program Automation and Electronics			х	х	х
Competent to apply theoretical and practical knowledge based on scientific principles for solving complex and real problems from practice			х	х	х
Completely trained for continuation of the scientific work, trained for publication of scientific and professional papers in scientific fields, such as automation, robotics, electronics and electronic systems		х	х		х
Has developed professional ethics and respect of professional norms			х	х	х
Understanding the importance and role of knowledge, experience and skills in making decisions on all levels of industrial/job environment			х	х	Х

Teaching methods	Teaching is conducted in the form of lectures, auditory and demonstration exercises on the computer. The colloquium and the written part of the exam are taken in written form, while the oral part of the exam is taken orally. The final grade of the exam will be based on the success of the colloquium, the written part and the oral part of the exam. The Moodle platform is used for creating the content of teaching units, storing teaching materials and results of pre-examination obligations and final examinations, as well as for communication with students.

Learning outcomes Prerequisites Teaching methods Subject content per weeks	ad of the subject (teaching + student): In <sub>opt</sub> = W + T = 75+105 = 180 hours per semester The course aims: 1. to teach students various methods of process identification. 2.to teach students various methods for designing control systems. 3. to teach students to use software tools MATLAB, SIMULINK and MAPLE, for identification of processes and designing control systems. 4. with the acquired knowledge, to create a basis to study other control theory related courses. There are no prerequisites for enrolling the course. It is necessary to have prior knowledge of the following subjects: Theory of Automatic Control - 1, Theory of Automatic Control - 2 Teaching is conducted in the form of lectures, auditory and demonstration exercises on the computer using software tools MATLAB, SIMULINK and MAPLE. Learning, tests, assignments and consultations. 1. Introductory considerations: Structures and models of control systems, transfer function, state-space equations. 2. Characteristics of control systems in time and frequency domain. Time and frequency response. 3. Identification of processes. Model selection and parameterization. 4. Relay experiment and phase-locked loop. Methods for process model reduction. Identification by physical modeling. 5. Design of single-input single-output (SISO) control systems. 6. System performance and robustness. Procedures for controller design. Modern controller design methods with respect to sensitivity and complementary sensitivity functions. 7. Control algorithms and their implementation. Discrete control laws. 8. Design of complex control systems. Control with disturbance compensation. Cascado							trol theory related ration exercises on earning, tests, tems, transfer Time and frequency odel reduction. sign. Modern ntary sensitivity
